Learning Log: Define problems and ask questions with data

Date: <enter date>	Course/topic: Course 2: Ask Questions to Make Data-Driven Decisions
	Learning Log: Define problems and ask questions with data
Summarize your findings	Create a summary of key information you think a stakeholder would need to know about this project. In this case, your stakeholder could be a member of the executive team, like a project manager. Here are some questions to help you get started: ● What is the problem? ● Can it be solved with data? If so, what data? ● Where is this data? Does it exist, or do you need to collect it? ● Are you using private data that someone will need to give you access to, or publicly available data? ● Who are the relevant sponsors and stakeholders for this project? Who is involved, and how? ● What are the boundaries for your project? What do you consider "in-scope?" What do you consider "out-of-scope?" ● Is there any other information you think is relevant to the project? ● Is there any information you need or questions you need answered before you can begin?
Reflection:	Write 5-7 sentences (100-140 words) summarizing the key questions, the data available, and the answers or insights you have gained so far
